

How firmly each decree citation is attached

Strongest tier at the top. Only the first was matched on both office and a published decree date; the last agreed on a year and nothing else, and the two in between are each strong on one axis and weak on the other. ``jort_match_basis`` and ``jort_date_kind`` form one ladder rather than two dimensions — a date-window match is always against a dated decree and a year-only match never is — so crossing them yields mostly structural zeros.
