

What a co-membership tie is worth

Weight is days of overlap, not a count of shared cabinets: two people who share a cabinet label but never sat in it together are not tied. The floor is 30 days — 0.08 on this axis — and raising it is a research decision `govtn.networks` exposes as a parameter. The tail past 20 years is not real service: it comes from the composite rosters that also inflate fig. 7, where one article covers a decade of reshuffles and every pair inside it inherits that span. Treat every weight as an upper bound.
