

Ministerial exit, and the global shocks

Share of those in office who leave that year

Descriptive, not an event study. Exit is recorded at reshuffle granularity: in the 18 years a cabinet was formed the median exit rate is 0.55, against 0.06 in the other 43. Four of the five shocks fall in ordinary years (1973: 0.16, 1979: 0.10, 2008: 0.03, 2022: 0.00); 2020 coincides with a cabinet formed for domestic reasons. Five shocks cannot be separated from that calendar, and the economic-portfolio share sits at its 0.19 overall mean in every shock window. Read this as the calendar, not as an effect.
